

## 29. ANGULOA Clowesii.

A. *Clowesii*; pedunculo unifloro radicali laxè squamato, flore carnosò resupinato, sepalis petalisque ovatis convexis conniventibus, labelli trilobi lobo medio piloso infundibulari bilabiato: labio altero emarginato altero tridentato, columnâ integrâ.

At last a genuine species of the genus *Anguloa*, which has hitherto puzzled every one, has made its appearance in the collection of the Rev. J. Clowes, of Broughton Hall near Manchester, who obtained it from Linden's Columbian collections. It is indeed a noble plant. The flowers are four inches in diameter, of a clear lemon colour, with a pure white lip. We refrain from doing more than announcing it, because it will soon be published with a plate in an early number of this work.
