

116. — d. — ONCIDIUM CAUDATUM. Huc: Lindl. Fol. p. 3: *Brassia caudata* Lindl. in Bot. Reg. t. 832. L. O. 212, Bot. Mag. 3451:

B. sepalis lateralibus longissimis acuminatissimis, petalis labello vix longioribus, labello ovato-oblongo apice subulato, lamellis pubescentibus apice liberis dentiformibus.

*Epidendrum caudatum* L. sp. pl., 1349.

*Malaxis caudata* W. sp. pl., iv. 93.

The shortness of the petals, which are not longer than the labellum, and the very great length of the lateral tail-like sepals are peculiar. The flowers are dull yellow, spotted with broad brown blotches. In Regel's Brazilian specimens, which are very ill-preserved and referred here with some doubt, the lip is obovate and extended into a long bristle-shaped point.

Wild in the West-Indies; Brazil—Regel?
