

The other species of this section are the following ; viz.

*O. brachyphyllum* ; foliis crassissimis brevibus erectis acutis, paniculâ laxâ pauciflorâ, sepalis petalisque obovatis acuminatis longè unguiculatis, labelli lobis lateralibus patentibus ovalibus acutis intermedio reniformi emarginato longioribus, tuberculo tricorni subverrucoso, columnæ alis sublunatis brevibus rotundatis.

This is a Mexican species, with very short stiff leaves, and smaller panicles, not above eighteen inches high.

*O. ascendens* ; foliis erectis junceis, scapo stricto paniculato æqualibus, sepalis petalisque obovatis obtusis concavis, labelli lobis lateralibus nanis erectis intermedio reniformi emarginato, tuberculo ovato 7-dentato, columnæ alis linearibus integerrimis incurvis.

This is from Guatemala, and has much the habit of *O. Cebolleta* ; but the linear wings of the column, the small erect lateral lobes of the lip, and the many-toothed tubercle distinguish it at once.

*O. Cebolleta*. Suprà fol. 1994.

Of this there are several varieties, one of which has the back of the lip covered with crimson spots, and another has no spots at all.

*O. nudum*. Suprà fol. 1994.
