

ZYGOPETALUM LAMINATUM, *n. sp.* *

A small-flowered Kefersteinia. Leaves rather narrow. Sepals and petals light yellow. Lip white, quite new in its affinity for its exceedingly large nearly totally free lamina at the base, white with numerous purple spots. Column very plump, three-lobed on each side, apiculate at the top, the last inferior lobe much angled in middle of the column, yellowish with green spots. I have, however, not much belief in the constancy of this lobing. I had this botanical curiosity last and this year from my excellent correspondent, Mr. J. Day, who informs me he sawed it named as *Zygopetalum forcipatum* in a celebrate emporium. As to myself, I had this [latter?] plant only from Messrs. Shuttleworth & Carder, and it is widely distinct in its lip, column, and colour. *H. G. Rchb. f.*

* *Zygopetalum* (*Kefersteinia*) *laminatum*, *n. sp.*—Foliis lineari lanceolatis ; pedunculo unifloro ; sepalis tepalisque ligulatis apiculatis , labello oblongo antice crispato denticulato ; lamella baseos pro maxima parte liberis prope dimidium labelli aequante, antice paulo medio fissa , columna medio obtusangula carina sub fovea obtusata. *H. G. Rchb. f.*
