

### 173. MAXILLĀRĨA porrecta.

M. *porrecta*; foliis oblongo-lanceolatis trinerviis, pedunculo erecto unifloro vaginato, sepalis linearibus apice concavis obtusis lateralibus incurvis, petalis conformibus, labello angusto apice trilobo medio calloso pubescente: lobo medio convexo rotundato margine crispo revoluto.

An uninteresting species, obtained by Messrs. Loddiges from Rio Janeiro. The flowers are about the size of those of *Maxillaria picta*, of a pale buff, with the sepals and petals tipped with dull red. The labellum is the same colour on the outside below the point.
