

### 38. ONCIDIUM lacerum.

- O. (TERETIFOLIA) *lacerum*; foliis longis teretibus carinatis, paniculâ contractâ multiflorâ, sepalis petalisque conformibus obovatis concavis, labelli elongati laciniis lateralibus linearibus refractis intermediâ longè et angustè unguiculatâ bilobâ margine lacerâ, cristæ dente altero transverso altero majore compresso a fronte, columnæ brevis pubescentis alis semiovatis.

Panama has furnished this very pretty species to Messrs. Loddiges, who flowered it in April 1844. It has very much the habit of *O. longifolium*, but has rather denser flowers, with a lacerated and rather crisp middle lobe to the lip, and a crest consisting of one transverse tubercle, like that of *O. nudum*, and another larger, compressed, rounded, and at right angles to it in front.
